

WordPress Local Website to GitHub Live Guide

A Complete Step-by-Step Deployment Blueprint for `http://skwebsoftcom.local`

Aapki WordPress website locally `http://skwebsoftcom.local` par chal rahi hai. GitHub Pages par dynamic PHP/Database websites seedhe nahi chal saktin (kyunki GitHub Pages sirf static HTML, CSS, aur JavaScript host karta hai). Is liye, is website ko GitHub par live karne ke liye hume ise **Static Website** me convert karna hoga.

Note: Is guide me hum aapko step-by-step bataenge ki kaise aap apni WordPress website ko HTML files me convert karke GitHub par bilkul free me live (publish) kar sakte hain.

Overview: Deployment Process

Step	Process / Action	Output / Result
Step 1	WordPress ko Static HTML me convert karna (using Plugin)	Aapke computer par HTML/CSS files ka ZIP ready ho jayega.
Step 2	GitHub par new Repository banana	GitHub Cloud par aapka hosting space create ho jayega.
Step 3	Files ko upload karna aur settings configure karna	Website files GitHub repository me safe ho jayengi.
Step 4	GitHub Pages ko active karna	Aapki website live URL par chalne lagegi (e.g., <code>username.github.io/repo</code>).

Step 1: Convert WordPress to Static HTML

Apne Local WordPress Dashboard (`http://skwebsoftcom.local/wp-admin`) par login karein aur niche diye gaye steps follow karein:

- Plugin Install Karein:** Plugins > Add New par jayein aur **"Simply Static"** ya **"WP2Static"** search karke install aur activate karein.
- Simply Static Settings:**
 - Dashboard ke menu me **Simply Static** par click karein.
 - Settings** me jayein aur "Delivery Method" ko **"ZIP Archive"** select karein.
 - "Destination URL" me wo URL dalein jo aapko GitHub par milega (e.g., `https://your-username.github.io/skwebsoftcom/`) ya fir default settings rehne dein aur replace baad me karein.

3. Generate Files:

- **Generate** tab par click karein aur "**Generate Static Files**" button dabayein.
- Kuch minutes me aapki puri website static HTML files me export ho jayegi.
- Export complete hone ke baad "**Click here to download**" par click karke `.zip` file apne computer par download kar lein.
- Is downloaded ZIP file ko apne computer par ek new folder (e.g., `skwebsoft-static`) me extract kar lein.

Important: Extract karne ke baad check karein ki आपके folder ke root me direct `index.html`, `wp-content/`, aur `wp-includes/` folders dikh rahe hon. Folder ke andar ek aur sub-folder nahi hona chahiye.

Step 2: Create a GitHub Repository

Ab आपको GitHub account par space setup karni hogi:

1. [GitHub.com](https://github.com) par login karein (agar account nahi hai to free signup karein).
2. Top-right corner me "+" icon par click karke "**New repository**" select karein.
3. **Repository Name:** `skwebsoftcom` ya apna pasandida name rakhein.
4. **Visibility:** Isko **Public** rakhein (GitHub Pages free hosting ke liye repository ka public hona zaroori hai).
5. **Initialize:** "Add a README file" ya koi bhi aur option check NA karein. Bilkul empty repository create karein.
6. **Create Repository** button par click karein.

Step 3: Upload Files to GitHub

Files upload karne ke 2 aasan tarike hain. Aap inme se koi ek select kar sakte hain:

Method A: Web Browser ke zariye (Aasan Tarika)

1. Repository create hone ke baad jo page open hoga, wahan आपको "**uploading an existing file**" ka link dikhega, uspar click karein.
2. Apne computer par extract kiye gaye static folder (`skwebsoft-static`) ke andar ki saari files ko select karein.
3. In sabhi files ko drag and drop karke browser screen par upload kar dein. (Dhyan rahe ki direct files/folders upload ho, na ki poora main folder).
4. Upload hone ke baad, page ke bottom me "**Commit changes**" button par click karein.

Method B: Git CLI ke zariye (Professional Tarika)

Agar aapke computer par Git installed hai, to commands run karein:

```
# Apne static folder ke andar terminal open karein
cd path/to/skwebsoft-static

# Git initialize karein
git init

# Files ko stage karein
git add .

# First commit karein
git commit -m "Initial commit of static WordPress site"

# Branch rename karein
git branch -M main

# GitHub Repository link connect karein (apna username change karein)
git remote add origin https://github.com/[YOUR-USERNAME]/skwebsoftcom.git

# Files push karein
git push -u origin main
```

Step 4: Enable GitHub Pages (To Go Live)

Aapki files upload ho chuki hain, ab ise live link par active karein:

1. GitHub par apni repository ke **Settings** tab me jayein.
2. Left sidebar me "Code and automation" section ke andar **"Pages"** par click karein.
3. **Build and deployment** section me:
 - Source: **"Deploy from a branch"** rakhein.
 - Branch: None ki jagah **"main"** (ya `master`) select karein, aur folder ko `/` (root) rehne dein.
4. **Save** button par click karein.
5. 1 se 2 minute wait karein, page ko refresh karein. Top par aapko aapka live site URL mil jayega:
`https://[your-github-username].github.io/skwebsoftcom/`

Troubleshooting Tip: Agar image ya styles load nahi ho rahi hain, to Simply Static settings me Destination URL me wahi link dalein jo GitHub Pages ne diya hai, aur fir se files generate karke upload karein. Isse saare relative links sahi kaam karenge.
